

Project Report: Iteration 1

Sean Shea & Jacob Ford
The RPG Platformer (Still Working Title)

Goals

The goal of this iteration was to set up development environments for team contributions, as well as testing those environments to verify meaningful work can be completed by all team members. In addition, there was an initial hope to make initial progress in developing each environment to better prepare for iteration two.

Tasks

Provided is the list of tasks originally planned from the initial write-up, as well as details regarding division of responsibility and task status.

- Create basic Unity project environment
 - Set up an environment to work with our 2D game in Unity with all initially needed assets
 - *Responsibility:* Sean
 - *Status:* Complete
- Set up a git hub directory
 - Create an online repository structure and verify all team members have equal access and permissions to contribute to project files.
 - *Responsibility:* Sean, Jacob
 - *Status:* Complete
- Talk exactly about how features should be added
 - There was some initial uncertainty regarding the exact method through which we wanted to implement the transitions between the platformer and RPG portions of the game. To properly design and begin implementing these elements we needed to figure out what elements and functions were needed for that transition.
 - *Responsibility:* Sean, Jacob
 - *Status:* Complete
- Create a starting basic platformer environment.

- Create a basic Scene and environment to begin developing the Platformer elements.
- *Responsibility:* Jacob
- *Status: Complete*
- Create a starting basic RPG environment.
 - Create a basic Scene and environment to begin developing the RPG elements.
 - *Responsibility:* —
 - *Status: Moved to Future Iteration*
- Create basic player designs and mechanics
 - Design different player types for the game, as well as how the players would operate
 - *Responsibility:* —
 - *Status: Removed till further Notice*
- Design Simple UI environment for both the platformer and RPG environments, as well as a simple menu, settings, and level select.
 - Set up initial UI environments to build off of.
 - *Responsibility:* Jacob, Sean
 - *Status: Moved to Future Iteration*

Completed Work

Unity Setup: Unity is now set up for us to work on together. To verify proper usability, initial progress on a platformer environment was tested and found successful, showing initial set-up matches our needs.

GitHub: GitHub is set up to allow both of us to work on the project independently on our own machines. In addition, initial commits have been made by all contributors showing proper group accessibility.

Planning: We now have a working design board regarding technical aspects of the game design, as well as a basic idea of how we want the two different game environments to interact with each other.

Platforming: While not fully fleshed out, there is a simple, very bare-bones platforming environment. It's still incomplete, however, the groundwork for it is in place.

Incomplete or Changed Work

Basic RPG Environment: Work on the RPG Element of the game has not been started yet due to lack of time and lower priority. Since we haven't fully discussed UI and turn-based elements in class yet, we decided to wait and see what is taught in class first.

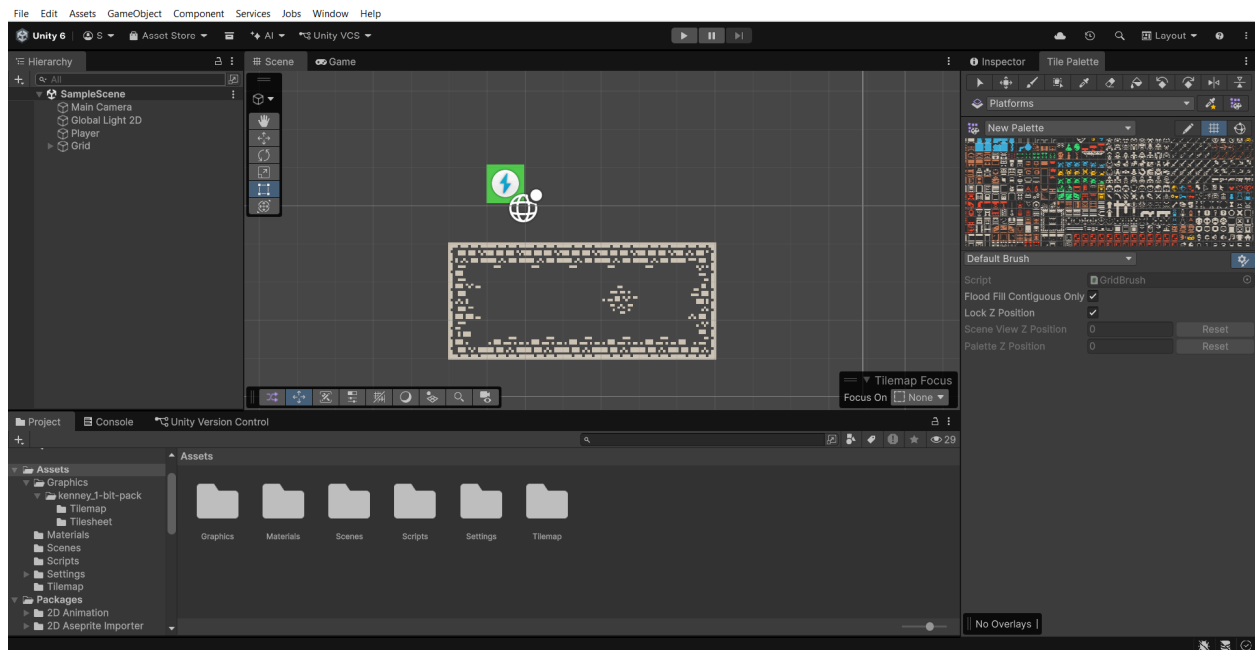

Player Design and Mechanics: It was deemed that this should be held off till we have a working game to build off of, as to not overcomplicate the initial design and development process.

UI environments and Menus: Did not have time to complete this for either environment, as deemed more important to focus on other elements of this iteration.

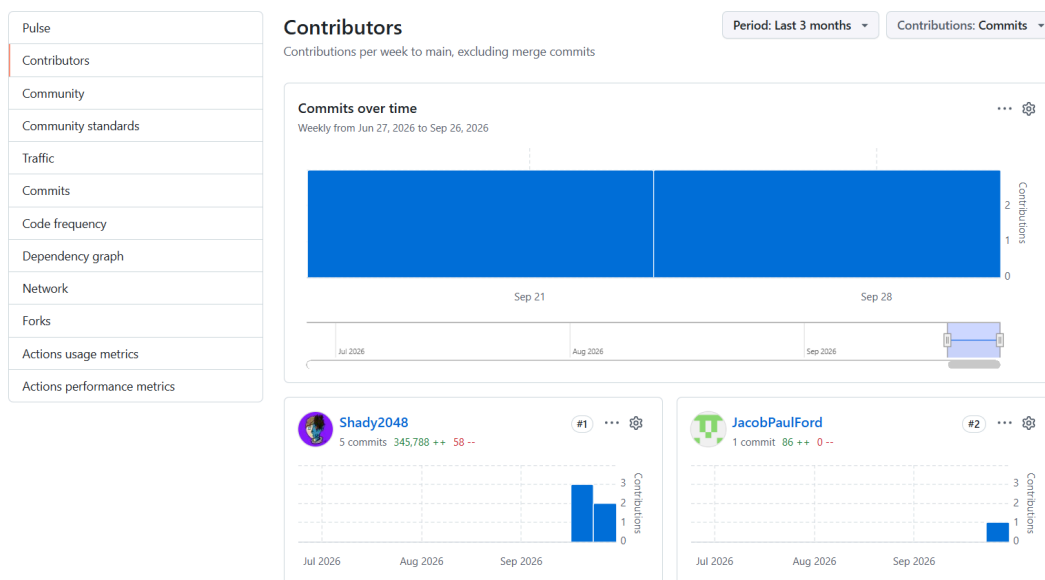

Changes From Initial Project Plan

We've decided to update from the initial idea of how the two systems will interact with each other. In the platforming section, we are going to allow a "taunt" button (some sort of engaging button) that allows you to engage an enemy in an RPG battle. This allows the player to decide how they wish to fight each enemy. We may make one enemy harder to fight in the platformer than in the RPG, or vice versa, and an element of the game will be discovering the easiest way for the player to fight each enemy. This allows for a clean melding of the two systems in a way that gives the player a choice.

Current Project Evidence

Unity environment of the testing scene.

Verification that all team members can meaningfully contribute to the github repository.

A video of the current project status is located in GitHub under “Iteration One Elements,” as well as a PDF of the current planning board that was developed.

Development and Contribution Evidence

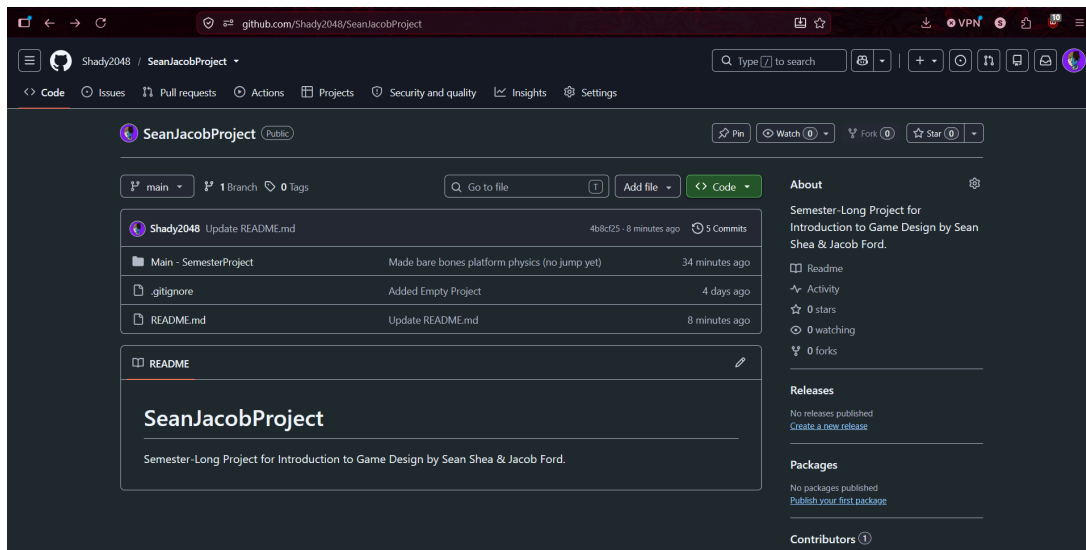

GitHub: <https://github.com/Shady2048/SeanJacobProject>

Note: GitHub names are as follows -

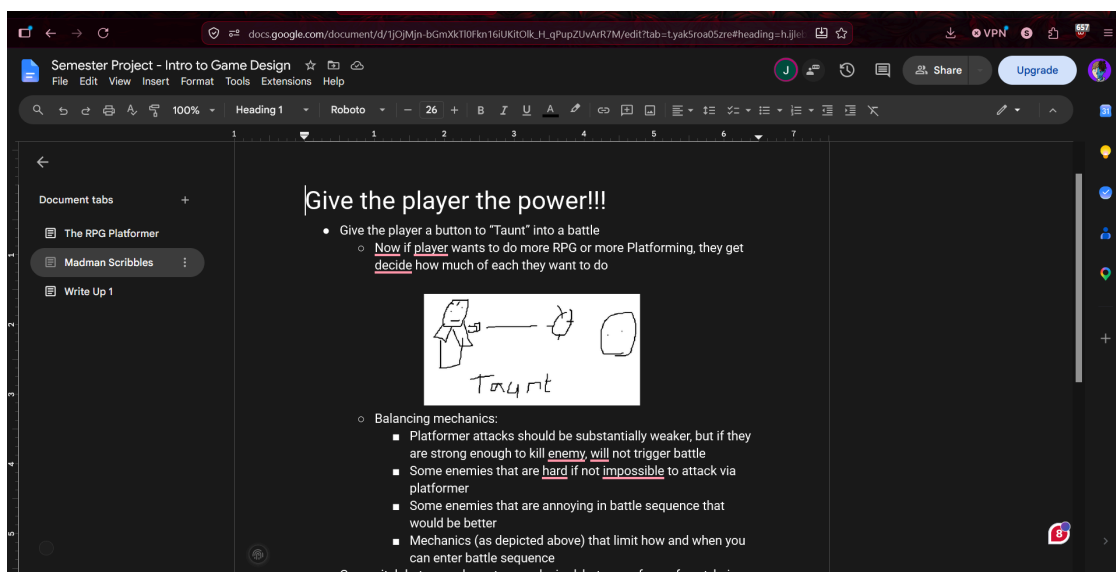

Jacob Ford - JacobPaulFord

Sean Shea - Shady2048

We uploaded the Unity Project to GitHub and are using it to allow both of us to work on the same project, where general contribution elements will be marked, and we are using Google Docs to manage our ideas and take notes on our thoughts to stay organized.

Our shared Google Doc for planning

Problems, Concerns, and Lessons Learned

It became apparent that flexibility as far as division or responsibility and the method through which tasks were completed is a necessity. Specifically, Jacob Ford lost the use of his computer for a portion of this iteration's development, so some of the initial steps were pivoted to be completed as a two person team in person. As such, some of the tasks will also be marked in the github repository as being completed by Sean because his device was the one the team used.

For future reference further establishing and exploring how to use the repository to manage workflow without competing branches being created may be necessary, so that the repository better reflects who completes what tasks.

Goals for Iteration 2

General Idea - Basic operational RPG and Platformer Scenes. Not yet linking the two gameplay forms, just operating on an individual basis. Note: iteration three will be focused on linking the two environments.

- RPG
 - Adding a basic battle, allowing for a character to fight an enemy with a list of action options (Fight, Magic, Flee, etc.) And have the enemy do a basic attack.
 - Visuals for HP, Mana? Enemy HP.
 - Make a system that allows a battle to be started, so that it's easy to repeat in the future.
 - Cement design for leaving battle sequences in various ways
- Platforming
 - Basic player and enemy physics
 - Simple Enemy AI for testing purposes
 - Attack features for player and Enemy
 - Combat requirement feature concept cemented
 - Basic level design created for player and enemy to traverse
- Working Placeholder animations
